Structured Exam Study Guide & Scenario Practice

Metric vs Indicator

Focus indicators

Diagrams & flows

Multi-answer practice

MEASURE · WHAT · MATTERS

Prepared 2026 · Based on your Measures & Metrics notes

How to Use This Guide

Your exam is **scenario-based** and **more than one option can be correct**. In Measures & Metrics the marks live in three places: (1) knowing the **core hierarchy cold** — Purpose → Objective → Indicator → Metric, and the difference between a **Measurement, a Metric, and an Indicator**; (2) matching a **named model or method** to the situation — Balanced Scorecard, Value Driver Framework, Gap Analysis, Benchmarking, Maturity; and (3) telling apart **look-alike pairs** — Effectiveness vs Efficiency, Leading vs Lagging, Utility vs Warranty, Vision vs Mission, Gap vs Maturity. Treat every option as its own true/false statement.

READ THE TRIGGER

"did it work?" → Effectiveness · "how well/cheaply?" → Efficiency · "predicts future" → Leading · "green report, unhappy customer" → Watermelon.

JUDGE EACH OPTION

Several statements can be true together — don't stop at the first correct one.

WATCH THE TRAPS

Each topic has an "Exam Trap" box showing the exact distinction examiners test.

Focus Indicator — what the signs mean

●●● HIGH FOCUS

Very likely in scenarios · master fully

●●○ MEDIUM FOCUS

Common distinctions · know the differences

●○○ SUPPORTING

Context & recall · lighter revision

Focus Priority Map

Topic	Focus	Why it matters for scenarios
Measurement vs Metric vs Indicator vs Report	●●● HIGH	The single most tested distinction — data vs meaning.
Goal Hierarchy (Purpose→Objective→Indicator→Metric) + SMART	●●● HIGH	The backbone of every measurement model.
Why You Measure — Validate·Influence·Justify·Intervene	●●● HIGH	Classic "which reason applies?" scenario.
Five Types of Measures + Effectiveness vs Efficiency	●●● HIGH	Right result vs right way — near-guaranteed question.
Success Factors & KPIs + Watermelon Effect	●●● HIGH	SF = what; KPI = how measured. Green-outside trap.
"What is Measured Gets Done" (behaviour)	●●● HIGH	Wrong metric → wrong behaviour scenarios.
Utility · Warranty · Experience (SLA / XLA)	●●● HIGH	What / How well / How it feels.
Balanced Scorecard (CFIL) + Leading vs Lagging	●●● HIGH	4 perspectives; predict vs report indicators.
Assessments — Gap · SWOT · CSAT · Benchmark · Maturity	●●● HIGH	Match the method to the situation.
Golden Circle · Vision→Operations	●●○ MED	Why/How/What; future vs present alignment.
Measurement Models overview + Planning & Evaluation	●●○ MED	Know each model's name and one-line purpose.
Value Driver Framework · Service Profit Chain	●●○ MED	Link technical metrics → business value.

Reporting (Data→Correlate→Interpret→Report→Action)	●●○ MED	Good report = data + analysis + action plan.
What to measure · cost of metrics · automate	●○○ SUP	Recognise the principle, don't rote-memorise.

1 · Start With Why — Golden Circle & Alignment

●●○ MEDIUM

CORE IDEA

Before creating any measure or metric, understand **WHY the organisation exists**. Good metrics align with the organisation's **Why** (purpose/mission), not just its outputs.

Simon Sinek's Golden Circle — Why → How → What

WHY — Purpose / Mission → HOW — Methods → WHAT — Products / Services

Level	Meaning	Question
Why (most important)	Purpose / mission / reason to exist	Why do we exist? — <i>Apple: "Think Different"</i>
How	Methods (processes, tech, service)	How do we do it?
What	Products / services offered	What do we provide? — <i>Apple: computers</i>

MEMORY TRICK

Start from the centre: Why → How → What. Customers connect with the **Why**, not just the What. Example — Why: improve customer satisfaction → Metric: CSAT score.

Vision → Mission → Strategy → Tactics → Operations

Vision — what we want to become (FUTURE)

Mission — why we exist TODAY

Strategy — the big overall plan

Tactics — specific methods to execute

Operations — day-to-day work (KPIs)

VISION VS MISSION ☆

Vision = Tomorrow (future, long-term, inspiring). **Mission = Today** (current purpose, what we do now).

METRICS AT EVERY LEVEL

Vision→long-term success · Mission→current performance · Strategy→progress · Tactics→project success · Operations→daily KPIs. Everything below **supports** what's above.

2 · Cascading Goals & the Goal Hierarchy ★★

... HIGH

CASCADING GOALS

Goals flow **top** → **bottom**: **Organisation** → **Department** → **Team** → **Individual**. Everyone's goals support the one organisational goal. **One big goal** → **many smaller goals**.

★ The Goal Hierarchy — memorise this chain

PURPOSE — Why are we doing this?

OBJECTIVES — What does success look like?

INDICATORS — How do we know we're succeeding?

METRICS — The actual numbers collected

Level	Answers	Example
Purpose	Why? (mission)	Happy customers
Objective	What success looks like	Deliver products quickly
Indicator	How we know we're succeeding	Response < 30 min · Resolution < 1 hr
Metric	Actual raw numbers	22 min · 45 min · 98% satisfaction

★ FEEDBACK LOOP — DIRECTION MATTERS

Planning goes Top → **Down** (Purpose→Metric). **Evaluation goes Bottom** → **Up** (Metric→Purpose). You use metrics to check whether the purpose is being achieved. An option reversing these directions is wrong.

★ SMART Goals

S · Specific

M · Measurable

A · Attainable

R · Relevant

T · Time-bound

BAD GOAL ❌

"Lose weight." / "Increase uptime." — no number, no deadline.

SMART GOAL ✅

"Lose 10 pounds in 90 days." / "Achieve 99.9% uptime within 12 months."

MEMORY TRICK

Purpose → **Objective** → **Indicator** → **Metric** (plan down) · **Metric** → **Indicator** → **Objective** → **Purpose** (evaluate up). Big Goal → Smaller Goals, all aligned.

3 · Measurement · Metric · Indicator · Report ☆☆☆

... HIGH — TOP TOPIC

THE GOLDEN RULE

You can't improve what you don't measure — but **data without context has little value**. The step from raw number to meaning is the most tested idea in this whole topic.

Data → Measurement → Metric → Indicator → Report

Term	Meaning	Example
Measurement	Collecting raw data in numbers	Response time = 25 min · CPU = 80%
Metric	A measurement monitored for management & improvement	Average response time · system uptime
Indicator ☆	Metric + Target + Trend → tells if performance is good/bad	Response 20 min, target < 30 min ✓ · icy: temp falling to 32°F
Report	Document that communicates results for decisions	Accurate · complete · organised · clear

☆ EXAM TRAP — METRIC VS INDICATOR

A **Metric** is just a raw number ("Response Time = 20 min" — not useful alone). An **Indicator** adds a **target + trend** so it supports a decision ("target < 30 min → goal met"). **Indicator = Metric + Meaning**. "Temperature = 32°F" is a metric; "temperature *falling to* 32°F, target = freezing → icy roads" is an indicator.

MEMORY TRICK

Metric = Number · Indicator = Number + Meaning · Data + Context = Information.

GOOD REPORT

Accurate, complete, well-organised, easy to understand.
Purpose: help management make decisions.

4 · Why You Measure — V·I·J·I ★★

●●● HIGH — TOP TOPIC

THE 4 REASONS TO MEASURE

We measure to make better decisions. Remember **VIJI**: **V**alidate · **I**nfluence · **J**ustify · **I**ntervene. Expect a scenario asking "which reason applies?"

Reason	Purpose	Trigger / example
Validate	Check if past decisions worked	"Did we achieve the goal?" — profit up after cost cut
Influence ★	Guide future behaviour & priorities	Set target 99.99% uptime → team focuses on reliability
Justify	Support decisions with evidence	High demand data → invest in more ITIL courses
Intervene ★	Detect problems early & correct	New product performs poorly → stop investing

MEMORY TRICK

Validate = did it work? · **Influence** = guide behaviour · **Justify** = prove with data · **Intervene** = fix before it's too late.

What should you measure?

DO MEASURE

The **Service Value System** — inputs, outputs, each activity, and **value delivered**. Measure what supports decisions and business goals. **Measure what matters.**

DON'T MEASURE

Everything. **More data ≠ better decisions.** Every metric has a **cost** (storage, processing, labour, analysis, reporting). If it gives no value, don't collect it.

BEFORE CREATING A METRIC, ASK 3 QUESTIONS

Does it support a goal? · Can I take action from it? · Is it worth the cost? — If **No**, don't measure it. **Review metrics regularly** (useful today ≠ useful forever) and **automate** collection to cut errors & labour.

5 · Five Types of Measures ★★

●●● HIGH — TOP TOPIC

THE 5 TYPES — REMEMBER P·C·E·E·P

Progress · Compliance · Effectiveness · Efficiency · Productivity. Each measures a different aspect of performance.

Type	Measures	Example
Progress	Degree of completion	% of software tested · % of project done
Compliance	Following rules / policies / regulations	% approved changes · % patched systems
Effectiveness ★	Was the goal achieved? (right thing)	% successful payments · % students passing
Efficiency ★	How well resources (time/cost/effort) used? (right way)	Time to create an account · processing time
Productivity	Output per time period	Tickets resolved per day · customers per hour

★ EXAM TRAP — EFFECTIVENESS VS EFFICIENCY

Effectiveness = the RESULT ("Did we succeed?" — doing the **right thing**). **Efficiency = RESOURCES used** ("How well/cheaply did we do it?" — doing **things right**). Student passes exam → **Effective**; passes in 3 hrs instead of 26 → **Efficient**. Utility↔fit for purpose links to effectiveness; Warranty↔fit for use links to efficiency/quality.

★ BALANCE ALL FIVE

Optimising one measure can damage another: high **Productivity** may cut **Quality**; high **Effectiveness** may need more time (lower **Efficiency**). Don't optimise one at the expense of the rest — an option that pushes a single measure to the extreme is usually wrong.

MEMORY TRICK

Effectiveness → Right Result · **Efficiency** → Right Way · **Productivity** → More output in less time.

6 · "What Is Measured Gets Done" ★★

... HIGH

THE PRINCIPLE

People focus on **what is measured**. Measure the wrong thing and people optimise the **wrong behaviour**. **Good metric** → **good behaviour**; **bad metric** → **bad behaviour**.

The classic worked example

Goal: increase Customer Satisfaction →

Metric chosen: cut Resolution Time 10 min → 2 min

WHAT AGENTS DID ✗

Closed tickets before solving them · escalated quickly to Tier 2/3 to hit the time target.

RESULT ✗

Resolution time "improved" ✓ but **satisfaction dropped** and Tier 2/3 got overloaded. The metric didn't match the goal.

★ THE LESSON

A good metric must improve the **real business goal**, not just the number. Here the measured metric (resolution time) did **not** align with the actual goal (customer satisfaction). **Measure the goal, not just the activity**.

RISKS OF POOR METRICS

Wrong behaviour · gaming/cheating the system · premature ticket closure · over-escalation · lower satisfaction.

GOOD MEASUREMENT PRINCIPLES

Align with business objectives · measure the right outcome · avoid encouraging bad behaviour · improve customer value.

MEMORY TRICK

Wrong Metric → **Wrong Behaviour**. **Right Metric** → **Right Behaviour**.

7 · Success Factors & KPIs ★★

... HIGH — TOP TOPIC

THE DISTINCTION TO MEMORISE

Success Factor = WHAT must be achieved ("What must happen to succeed?"). **KPI = HOW we measure it** ("How do we know we're succeeding?"). SF is the goal; KPI is the measurement.

Success Factor (PSF / CSF)	KPI (Key Performance Indicator)
What must be achieved — the condition for success	How success is measured
Example: "Improve the service"	Example: Customer satisfaction = 95% · ROI

Success Factor → KPI → Indicator (Target + Trend) → Measure Performance

SMART KPI

Specific · Measurable · Achievable · Relevant · Time-bound.

✗ "Increase uptime" → ✓ "Achieve 99.9% uptime within 12 months."

KPI BECOMES USEFUL WITH...

a **Target** + a **Trend**. e.g. KPI = ROI · Target = 200% · Trend = higher is better. ITIL KPI examples: ROI, % successful improvements, % projects on time, productivity index.

★ WATERMELON EFFECT 🍉

Everything looks **GREEN** on the report... but the organisation is failing (**RED** inside). All KPIs achieved ✓ yet customers still unhappy ✗. **Cause: measuring the wrong KPIs**. Green outside, red inside — a favourite scenario about misleading dashboards.

MEMORY TRICK

Success Factor = WHAT must succeed · KPI = HOW we measure it. Watermelon = Green reports, red reality.

8 · Utility · Warranty · Experience ★★

●●● HIGH — TOP TOPIC

EVERY SERVICE IS MEASURED ON 3 CHARACTERISTICS

Utility = what the service does · Warranty = how well it performs · Experience = how the customer feels.

Utility — What?

Warranty — How well?

Experience — How it feels?

Characteristic	Answers	Measures / examples
Utility ★	Fit for Purpose — works / doesn't	File upload works · send email · make a call
Warranty ★	Fit for Use — quality	Availability, Performance, Capacity, Continuity, Security, Compliance · 99.9% uptime
Experience ★	Customer/User feeling (CX/UX)	User errors, abandoned checkouts, cancellations, CSAT

★ EXAM TRAP — UTILITY VS WARRANTY

Utility = What (features / fit for purpose). **Warranty = How well (quality / fit for use).** "Can I make a call?" = Utility. "Call quality, network availability, speed" = Warranty. Availability/Capacity/Security/Continuity are all **Warranty**, never Utility.

SLA — SERVICE LEVEL AGREEMENT

Defines Service (what) + Level (targets) + Agreement (accepted terms). Includes agreed targets for **Utility & Warranty**.

XLA — EXPERIENCE LEVEL AGREEMENT

Experience is increasingly managed via **XLAs** — targets for how users *feel* (CX/UX), beyond just utility & warranty.

MEMORY TRICK

Utility → What · Warranty → How Well · Experience → Feeling.

9 · Measurement Models & Planning/Evaluation

●●○ MEDIUM

KNOW THE 5 MODEL NAMES + ONE-LINE PURPOSE

Models give a structured way to measure success: **Plan** → **Measure** → **Improve**.

Model	Purpose
Planning & Evaluation Model	Align purpose → metrics; plan goals and evaluate results
Balanced Scorecard	Measure performance from 4 balanced perspectives
Organizational Improvement Cascade	Align goals from organisation down to teams/individuals
Value Driver Framework	Link technical metrics to business value
Service Profit Chain	Employee satisfaction → customer satisfaction → profit

Planning & Evaluation Model ★★☆☆

PLANNING — TOP → DOWN

Purpose → Objectives → Indicators → Metrics. **Define** ↓.

EVALUATION — BOTTOM → UP

Metrics → Indicators → Objectives → Purpose. **Evaluate** ↑.

Level	Question	Example
Purpose	Why?	Improve customer satisfaction
Objectives	What does success look like?	Reduce response time
Indicators	How do we know success?	Response < 30 min
Metrics	Actual numbers	24 min

★ EXAM TRAP — INTERESTING ≠ USEFUL

"3 million video minutes watched" is a real **metric** but a **poor indicator** — it doesn't help a business decision. Relationship is **1 Purpose** → **many Objectives** → **many Indicators** → **many Metrics**. Best practice: progress iteratively, think holistically (not only IT), keep it simple. **Over-measuring and under-measuring are both bad.**

10 · Balanced Scorecard + Leading/Lagging ★★

... HIGH

WHAT IT IS

A strategic management framework that measures whether the organisation is achieving its **vision & strategy** from **4 balanced perspectives** — not just money. Remember **C·F·I·L**.

Perspective	Question	Measures
👥 Customer	How do customers see us?	Satisfaction, delivery, loyalty
💰 Financial	How do shareholders see us?	Revenue, profit, cash flow, ROI
⚙️ Internal Process	What must we excel at?	Cycle time, cost, quality, productivity
📖 Learning & Growth	How can we improve/innovate?	Training, knowledge, innovation, time to market

WHY "BALANCED"?

It measures **all four** areas, not just finance. Only-profit = not balanced. For each perspective have ≥ 1 Objective, ≥ 1 Indicator, ≥ 1 Metric. Structure: Vision/Strategy → 4 Perspectives → Objectives → Indicators → Metrics.

★ Leading vs Lagging Indicators

Leading — predicts future	Lagging — measures past
Proactive · helps prevent problems	Reactive · shows what already happened
Trainings, DR drills, code reviews	Customer satisfaction, profit, revenue, # incidents

★ EXAM TRAP

Leading = predicts (future, proactive). Lagging = reports (past, reactive). Number of training sessions is **leading**; profit and customer satisfaction are **lagging**. Don't swap them.

MEMORY TRICK

CFIL = Customer · Financial · Internal Process · Learning & Growth. Leading = look ahead · Lagging = look back.

11 · Improvement Cascade & Measuring Outcomes

●●○ MEDIUM

ORGANIZATIONAL IMPROVEMENT CASCADE

Aligns goals, metrics **and improvement plans** across every level: **Organisation** → **Department** → **Team** → **Individual**. Every lower goal supports the one above; results flow back up. **Alignment matters more than individual metrics.**

★ OUTCOMES VS OUTPUTS

Measure **value (outcomes)**, not just activities (outputs). Easy to measure: tickets, uptime, CPU. Hard to measure: customer value, business outcome, user success — that's why ITIL uses **frameworks** to connect technical metrics to value.

Value Driver Framework ★★☆☆ — small metrics support business value

Service Profit Chain ★★☆☆ — happy employees → happy customers → profit

QUALITATIVE OUTCOMES

Knowledge, skills, culture, attitude, experience → measure with **surveys, interviews, feedback, observation**. Use **Value Stream Mapping** to find bottlenecks & improve flow.

MEMORY TRICK

Value Driver: technical metric → customer value. **Service Profit Chain:** Happy Employees → Happy Customers → More Profit.

12 · Assessments — Gap & SWOT ★★

●●● HIGH — TOP TOPIC

WHAT IS AN ASSESSMENT?

Analysing collected data to understand the **current state** and identify improvements: **Metrics** → **Measurements** → **Assessment** → **Action**. Repeat regularly during Continual Improvement; more than one method can be used.

★ THE 5 METHODS — REMEMBER G·S·C·B·M

Gap Analysis · SWOT · Customer/User Satisfaction · Benchmarking · Maturity Assessment.

Gap Analysis — Current vs Desired

Current State → GAP (Delta) → Desired Future State

GAP = DELTA

Gap = Desired – Current. e.g. availability 95% → target 99.9% = 4.9% gap. Compare vs desired state, competitors, customer expectations, or compliance.

GAP IS DYNAMIC ★

The gap is **not fixed** — business, customer needs and tech change. So **repeat Gap Analysis regularly**. Limitations: time-consuming, subjective, may miss overlapping roles.

SWOT Analysis — Internal vs External

Internal factors	External factors
Strengths — what we're good at (skilled staff, reputation)	Opportunities — new tech, growing market, partnerships
Weaknesses — what to improve (legacy systems, high cost)	Threats — competitors, regulations, cyber-attacks

★ EXAM TRAP

SW = Inside the organisation · **OT = Outside**. A new competitor or regulation is a **Threat (external)**, never a weakness. SWOT gives no ranking and is subjective.

MEMORY TRICK

GSCBM. Gap = "how far from where we want to be?" · SWOT: **SW inside, OT outside**.

Customer / User Satisfaction Analysis

CUSTOMER VS USER ★

Customer pays for the service · **User uses** it. Sometimes same person, sometimes different — if different, **assess both separately**.

DRAWBACK — SURVEY FATIGUE

Too many surveys → users stop caring / give random answers. Responses may be dishonest (positive just to end the call). Keep surveys short, well-timed, to the right people.

Benchmarking — compare with others

Compare → Find Gaps → Learn Best Practices → Improve

★ EXAM TRAP — DON'T COPY BLINDLY

Compare only with **similar** organisations (same industry/customers/services). Benchmarking shows **what** others achieve, not **why**; industry leaders **aren't always** best practice. **Gap Analysis = internal (current vs desired)**; **Benchmarking = external (vs another org)**.

Maturity Assessment — how capable is the process?

Level 1 · Initial → Level 3 · Well Defined → Level 5 · Optimized

★ EXAM TRAP — HIGHER IS NOT ALWAYS BETTER

Measures capability against a maturity model (e.g. 1–5). But **higher maturity = higher cost/effort**. Don't chase Level 5 for its own sake — choose the level that gives **enough business value** (small firm may need Level 3; global bank may need Level 5). **Maturity output = a level**; **Gap output = a delta**.

MEMORY TRICK

CSAT: customer pays, user uses. **Benchmark = Best Mark** (external). **Maturity**: "how mature?" — value over level.

14 · Reporting + Master Revision Table

●●○ MEDIUM

WHAT IS A REPORT?

Structured communication of information to help people **make decisions** — it converts data into useful information. Flow: **Data** → **Correlate** → **Interpret** → **Report** → **Decision** → **Action** (D-C-I-R-D-A).

BAD REPORT ❌

Raw data only, too many numbers, no analysis, no conclusion. "Uptime = 99.5%" (no meaning).

GOOD REPORT ✅

Explains data, shows trends, gives conclusions + **actions**.
"Uptime dropped to 99.5%, below 99.9% target → Action: upgrade infra."

★ KEY PRINCIPLE

A report creates **awareness**; a report + **action plan** creates **improvement**. Customers look for **ROI**, **SLA achievement**, **strategic objectives**, **satisfaction**. Tailor to the audience; avoid data fatigue.

★ Master Revision — highest-yield look-alike pairs

Pair	Left	Right
Metric vs Indicator	Raw number only	Number + Target + Trend (meaning)
Effectiveness vs Efficiency	Did we succeed? (right thing / result)	How well/cheaply? (right way / resources)
Utility vs Warranty	What it does · fit for purpose	How well · fit for use (avail/cap/sec/cont)
Vision vs Mission	Tomorrow (future)	Today (present purpose)
Leading vs Lagging	Predicts future · proactive	Measures past · reactive
Success Factor vs KPI	WHAT must be achieved	HOW success is measured
Gap vs Benchmarking	Internal: current vs desired	External: vs another organisation
Gap vs Maturity	Output = delta (difference)	Output = maturity level
Customer vs User	Pays for the service	Uses the service
SWOT: SW vs OT	Strengths/Weaknesses = internal	Opportunities/Threats = external

ONE-LINE RECALLS

VIJI (why measure) · **PCEEP** (5 measures) · **CFIL** (scorecard) · **GSCBM** (assessments) · **DCIRDA** (reporting) · **Watermelon** 🍉 (green report, red reality).

Scenario Practice — Set A

Each question can have **more than one correct statement**. Decide each option true/false, then check the green answer box.

Q1. A service desk reports "Average Resolution Time = 20 minutes." Management can't tell whether this is good. Which statements are correct?

- A. As stated, 20 minutes is a **metric** — a raw measured value.
- B. Adding "target < 30 min, trend improving" turns it into an **indicator**.
- C. The number alone is enough for a decision; context adds nothing.
- D. Data without context has little value.

Correct: A, B, D. A metric is a raw number; an **indicator = metric + target + trend**. **Why not C** Data without context can't drive a decision — the whole point of an indicator is to add meaning.

Q2. A company sets a single target — "cut incident resolution time from 10 to 2 minutes" — to raise customer satisfaction. Agents start closing tickets early and over-escalating. Which statements are correct?

- A. This illustrates "what is measured gets done" — people optimise the measured number.
- B. The metric is misaligned with the real goal (satisfaction), causing bad behaviour.
- C. A good metric should improve the real business goal, not just the number.
- D. The problem proves you should never measure resolution time.

Correct: A, B, C. Wrong metric → wrong behaviour; measure the goal, not just the activity. **Why not D** Resolution time is fine *if balanced* with satisfaction metrics — the fault is misalignment, not the metric existing.

Q3. Two teams debate a service. Team X says "students can log in and watch the course" is the key measure; Team Y says "99.9% availability and fast load times." Which statements are correct?

- A. Team X is describing **Utility** — what the service does (fit for purpose).
- B. Team Y is describing **Warranty** — how well it performs (fit for use).
- C. Availability and performance are Warranty measures.
- D. "Fit for purpose" is a Warranty term.

Correct: A, B, C. Utility = what/fit for purpose; Warranty = how well/fit for use (availability, performance, capacity, security). **Why not D** "Fit for **purpose**" is **Utility**; "fit for **use**" is Warranty.

Q4. A manager sets a public target of 99.99% uptime so the team prioritises reliability, and later reviews data to confirm a past cost-cut worked. Which "reasons to measure" are shown?

- A. Setting the uptime target to steer behaviour = **Influence**.
- B. Confirming the past decision worked = **Validate**.
- C. Both are part of the VIJI reasons to measure.
- D. Neither relates to why organisations measure.

Correct: A, B, C. Influence guides future behaviour; Validate checks past decisions — both in **VIJI** (Validate, Influence, Justify, Intervene). **Why not D** These are two of the four core reasons to measure.

Scenario Practice — Set B

Q5. A student passes the ITIL exam after studying just 3 hours instead of the usual 26. Which statements are correct?

- A. Passing the exam shows **Effectiveness** — the goal was achieved.
- B. Doing it in 3 hours shows **Efficiency** — fewer resources used.
- C. Effectiveness = right result; Efficiency = right way (resources).
- D. Effectiveness and Efficiency mean the same thing.

Correct: A, B, C. Effectiveness = did we succeed (result); Efficiency = how well/cheaply (time, cost, effort). **Why not D** They are distinct — you can be effective but inefficient, or efficient at the wrong thing.

Q6. A monthly dashboard shows every KPI green, yet customer complaints keep rising. Which statements are correct?

- A. This is the **Watermelon Effect** — green outside, red inside.
- B. The likely cause is measuring the **wrong KPIs**.
- C. KPIs should align with real success factors and business outcomes.
- D. Because KPIs are green, no action is needed.

Correct: A, B, C. Watermelon = KPIs look good while reality fails, caused by measuring the wrong things. **Why not D** Rising complaints are a red flag — the dashboard is misleading, not reassuring.

Q7. A firm builds a Balanced Scorecard. It tracks number of staff trainings and DR drills, plus revenue and customer satisfaction. Which statements are correct?

- A. Trainings and DR drills are **leading** indicators — they predict future performance.
- B. Revenue and customer satisfaction are **lagging** indicators — they report the past.
- C. The scorecard's four perspectives are Customer, Financial, Internal Process, Learning & Growth.
- D. A scorecard that tracks only financial measures is still "balanced".

Correct: A, B, C. Leading = proactive/predictive; lagging = reactive/historical; perspectives = **CFIL**. **Why not D** "Balanced" requires all four perspectives — finance-only is exactly what the model avoids.

Q8. A team must choose an assessment method to compare its incident process (8-hour resolution) against an industry leader's (4 hours). Which statements are correct?

- A. **Benchmarking** fits — comparing against another organisation.
- B. They should compare with a **similar** organisation for the result to be meaningful.
- C. Benchmarking shows **what** others achieve but not always **why**.
- D. They should copy the leader's process exactly, without understanding context.

Correct: A, B, C. Benchmarking = external comparison with similar orgs; it reveals results, not reasons. **Why not D** Blind copying is a known limitation — leaders aren't always following best practice.

Scenario Practice — Set C

Q9. A company wants to know how far its current service is from where it needs to be, and separately rate how mature its change process is on a 1–5 scale. Which statements are correct?

- A. Comparing current vs desired state is a **Gap Analysis**; output is a delta.
- B. Rating the process 1–5 against a model is a **Maturity Assessment**; output is a level.
- C. A higher maturity level is always the right target regardless of cost.
- D. The gap can change over time, so Gap Analysis should be repeated.

Correct: A, B, D. Gap = current vs desired (delta, dynamic); Maturity = capability level vs a model. **Why not C** Higher maturity costs more — choose the level that gives **enough business value**, not automatically Level 5.

Q10. Leadership wants goals that align every level of the organisation and are worth measuring. Which statements are correct?

- A. The **Organizational Improvement Cascade** aligns goals Organisation → Department → Team → Individual.
- B. Each goal should be **SMART** (Specific, Measurable, Attainable, Relevant, Time-bound).
- C. The goal hierarchy is Purpose → Objective → Indicator → Metric.
- D. Individual metrics matter more than alignment to the organisation's goal.

Correct: A, B, C. Cascade aligns levels; goals should be SMART; hierarchy flows Purpose→Metric. **Why not D** ITIL stresses **alignment** above isolated metrics — a lower goal exists to support the one above it.

Q11. An analyst wants to show how a low-level technical metric ultimately supports business value, and why keeping staff satisfied matters financially. Which statements are correct?

- A. The **Value Driver Framework** links Resource → Service (Utility+Warranty) → Experience → Objectives → Purpose.
- B. The **Service Profit Chain** links employee satisfaction → customer satisfaction → profit.
- C. Outcomes (value) are generally harder to measure than outputs (activities).
- D. CPU usage is a business outcome, not a technical output.

Correct: A, B, C. Value Driver connects technical metrics to customer purpose; Service Profit Chain ties happy employees to profit; outcomes are harder than outputs. **Why not D** CPU usage is a technical **output/metric**, not a business outcome.

Q12. A service owner writes a report: "Uptime dropped to 99.5%, below the 99.9% target. Action: upgrade infrastructure and improve monitoring." Which statements are correct?

- A. This is a **good report** — it interprets data and includes an action plan.
- B. A report creates awareness; a report + action plan creates improvement.
- C. Reporting flow is Data → Correlate → Interpret → Report → Decision → Action.
- D. A report of raw numbers with no analysis would be equally useful.

Correct: A, B, C. Good reports explain trends and recommend action; flow = **DCIRDA**. **Why not D** Raw numbers with no analysis or conclusion is exactly the "bad report" pattern.

FINAL REVISION — SAY THESE OUT LOUD

VIJI = why measure · **PCEEP** = five measures · **CFIL** = Balanced Scorecard · **GSCBM** = assessments · **DCIRDA** = reporting · Purpose→Objective→Indicator→Metric (plan down, evaluate up) · Metric = number, Indicator = number + meaning · Watermelon 🍉 = green report, red reality.
